

TCS Financial & Operating Performance Analysis | Power BI

An end-to-end Power BI project that transforms TCS's financial and operating data into an interactive five-page report. The project helps users understand revenue growth, profitability, cost pressures, workforce trends, and geographic performance.

Using **Power Query**, I cleaned and combined historical and recent Excel data, standardized metric names and units, and prepared quarterly datasets. I built a dimensional data model and developed **DAX measures** for matching-period comparisons, trailing twelve-month revenue, margin changes, cost contributions, and scenario analysis.

The report covers five business areas:

- **Executive Overview:** Key financial results and performance trends.
- **Growth & Profitability:** Revenue growth, margin pressure, and the factors contributing to operating profit changes.
- **Cost & Workforce:** Cost patterns, headcount trends, and revenue per employee.
- **Geography & Operating Drivers:** Regional revenue concentration and constant-currency growth.
- **Scenario & Methodology:** Adjustable revenue and cost assumptions to explore their impact on operating profit.

Interactive filters, navigation, conditional formatting, and dynamic business commentary help users explore performance and identify areas for further investigation.

Tools: Power BI Desktop, Power Query, DAX, and Excel.

Project purpose: An independent portfolio analysis demonstrating how financial data can support business decisions. Scenario results illustrate assumptions and are not forecasts.
